

**question1 :A)**

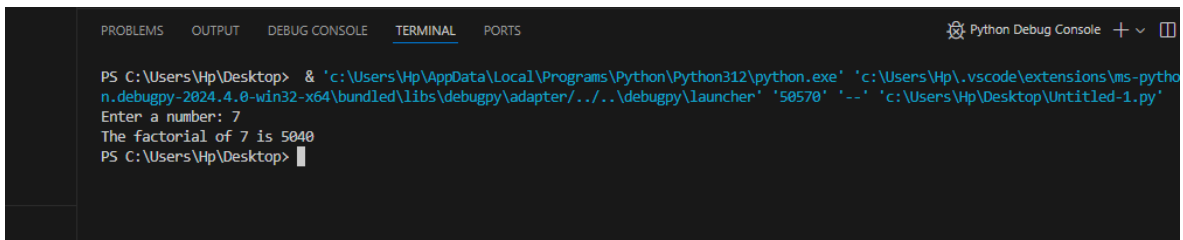

```
L1 = ['HTTP', 'HTTPS', 'FTP', 'DNS']      #creat first list
L2 = [80, 443, 21, 53]                  #creat second list
M = {key: value for key, value in zip(L1, L2)}      # creat dictionary
print(M)
```

```
# Define the list.py'
{'HTTP': 80, 'HTTPS': 443, 'FTP': 21, 'DNS': 53}
PS C:\Users\Hp\Desktop>
```

**B)**

```
def factorial(n):
    if n < 0:
        return "Factorial is not defined for negative numbers."
    elif n == 0 or n == 1:
        return 1
    else:
        return n * factorial(n - 1)
number = int(input("Enter a number: "))
result = factorial(number)
print(f"The factorial of {number} is {result}")
```

#define a function with one parameter n this function returns the factorial for un inserted number n

A screenshot of a Python Debug Console window. The window has tabs for PROBLEMS, OUTPUT, DEBUG CONSOLE, TERMINAL, and PORTS. The TERMINAL tab is active, showing a command prompt session. The command prompt shows the execution of a Python script using the debugpy adapter. The script prompts for a number, and the user enters 7. The output shows that the factorial of 7 is 5040.

```

```

```

Python Quiz Program
Enter 't' for True or 'f' for False (if applicable)
Enter your full name: hala hawla
Question 1 : What is 3+3?
The answer is: 6
Correct
Question 2 : What is 4*4?
The answer is: 16
Correct
Question 3 : Who wrote 'Romeo and Juliet'?
The answer is: me
Wrong
Question 4 : What is the chemical symbol for water?
The answer is: 

```

QUESTION4:

```

#creat a class
